

MICRODCI PRODUCT LIFECYCLE STATEMENT

This document confirms MicroMod Automation & Controls, Inc.'s ongoing commitment to the MicroDCI family of products, including the 53MC5000 Process Control Station and the 53SL6000 Micro-Mite controller. We believe the products provide significant benefits for the process industries and we consider them to be at the core of our business strategy.

Since the acquisition of the business in 2004, MicroMod has continued to produce the MicroDCI products in the same facility, with the same state-of-the-art manufacturing procedures, to ensure delivery of high-quality, high-reliability controllers. Many of our vendors have migrated to new technology components and we have continued to incorporate their new technology into the Micro-DCI products while maintaining the functionality and operational characteristics desired by our customers.

MicroMod maintains its policy of ongoing enhancements and improvements to protect our clients' investments in control systems, take advantage of new technologies, and ensure the products' continued applicability to the demands for increased productivity and more cost-effective solutions.

MicroMod has no plans to discontinue the manufacture of the MicroDCI controllers, configuration software, or communication software. Like any forward-thinking company, while we are planning new projects that take advantage of new technologies, it is extremely important to us to ensure their compatibility with our existing products in the future. However, we expect to actively market the MicroDCI family of products for at least another eight to ten years, and to support our very large installed base for many years afterward with spare parts, repairs, and new technology replacement products.

Sincerely,

Carol A. McNelly
Vice President, Product Manufacturing
